

**IN THE SPECIFICATION**

**The Applicants request that the paragraph labeled [0005] in the published document of this application be replaced with the following paragraph:**

The U.S. Pat. No. 4,837,635 discloses a method that allows the user to first obtain a primitive scanned image from the scanner, and then specify suited image processing settings such as size and scan area for the scanner to perform a second scan operation on the original document to thereby obtain a final scanned image. By this method, the final scanned image is ~~closed close~~ in image qualities to the original document. One drawback to this patent, however, is that it is quite laborious to use due to the reason that it requires the user to specify the settings. Moreover, it is still insufficient in functionality to meet user demands in high-end image processing.
